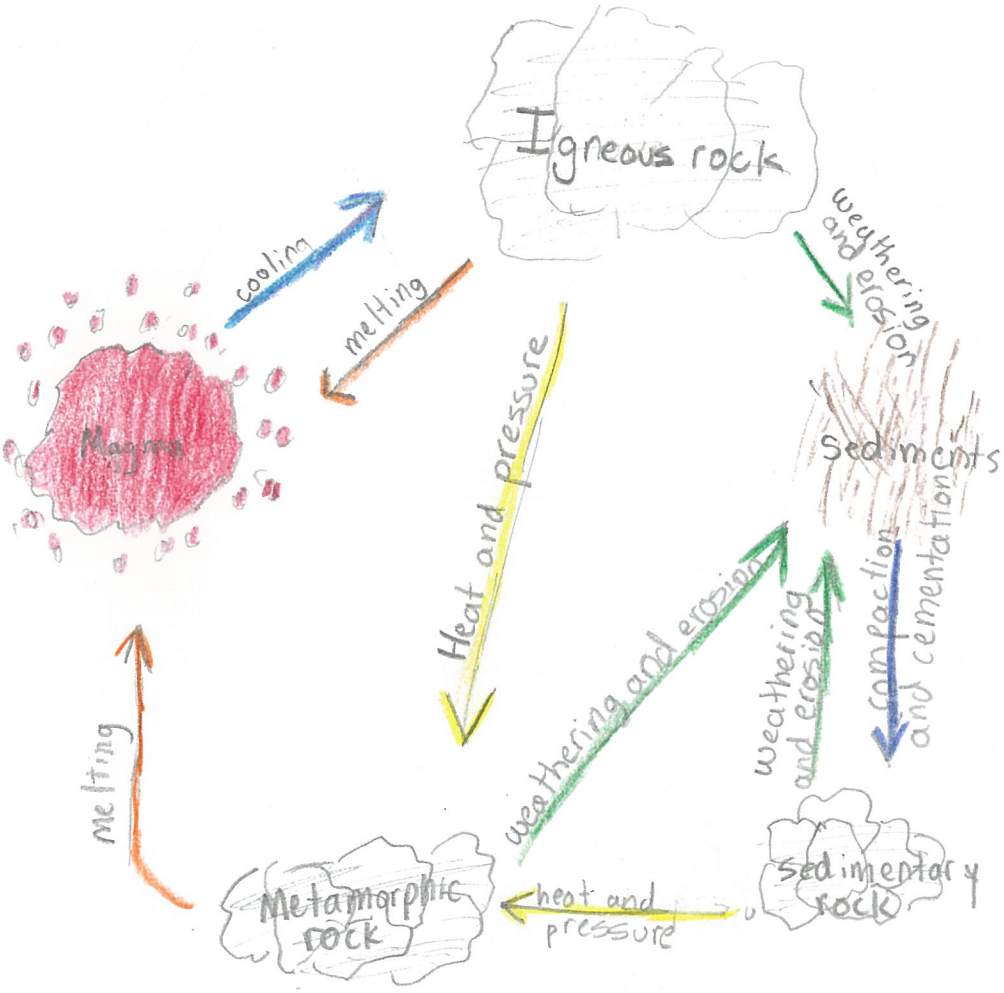
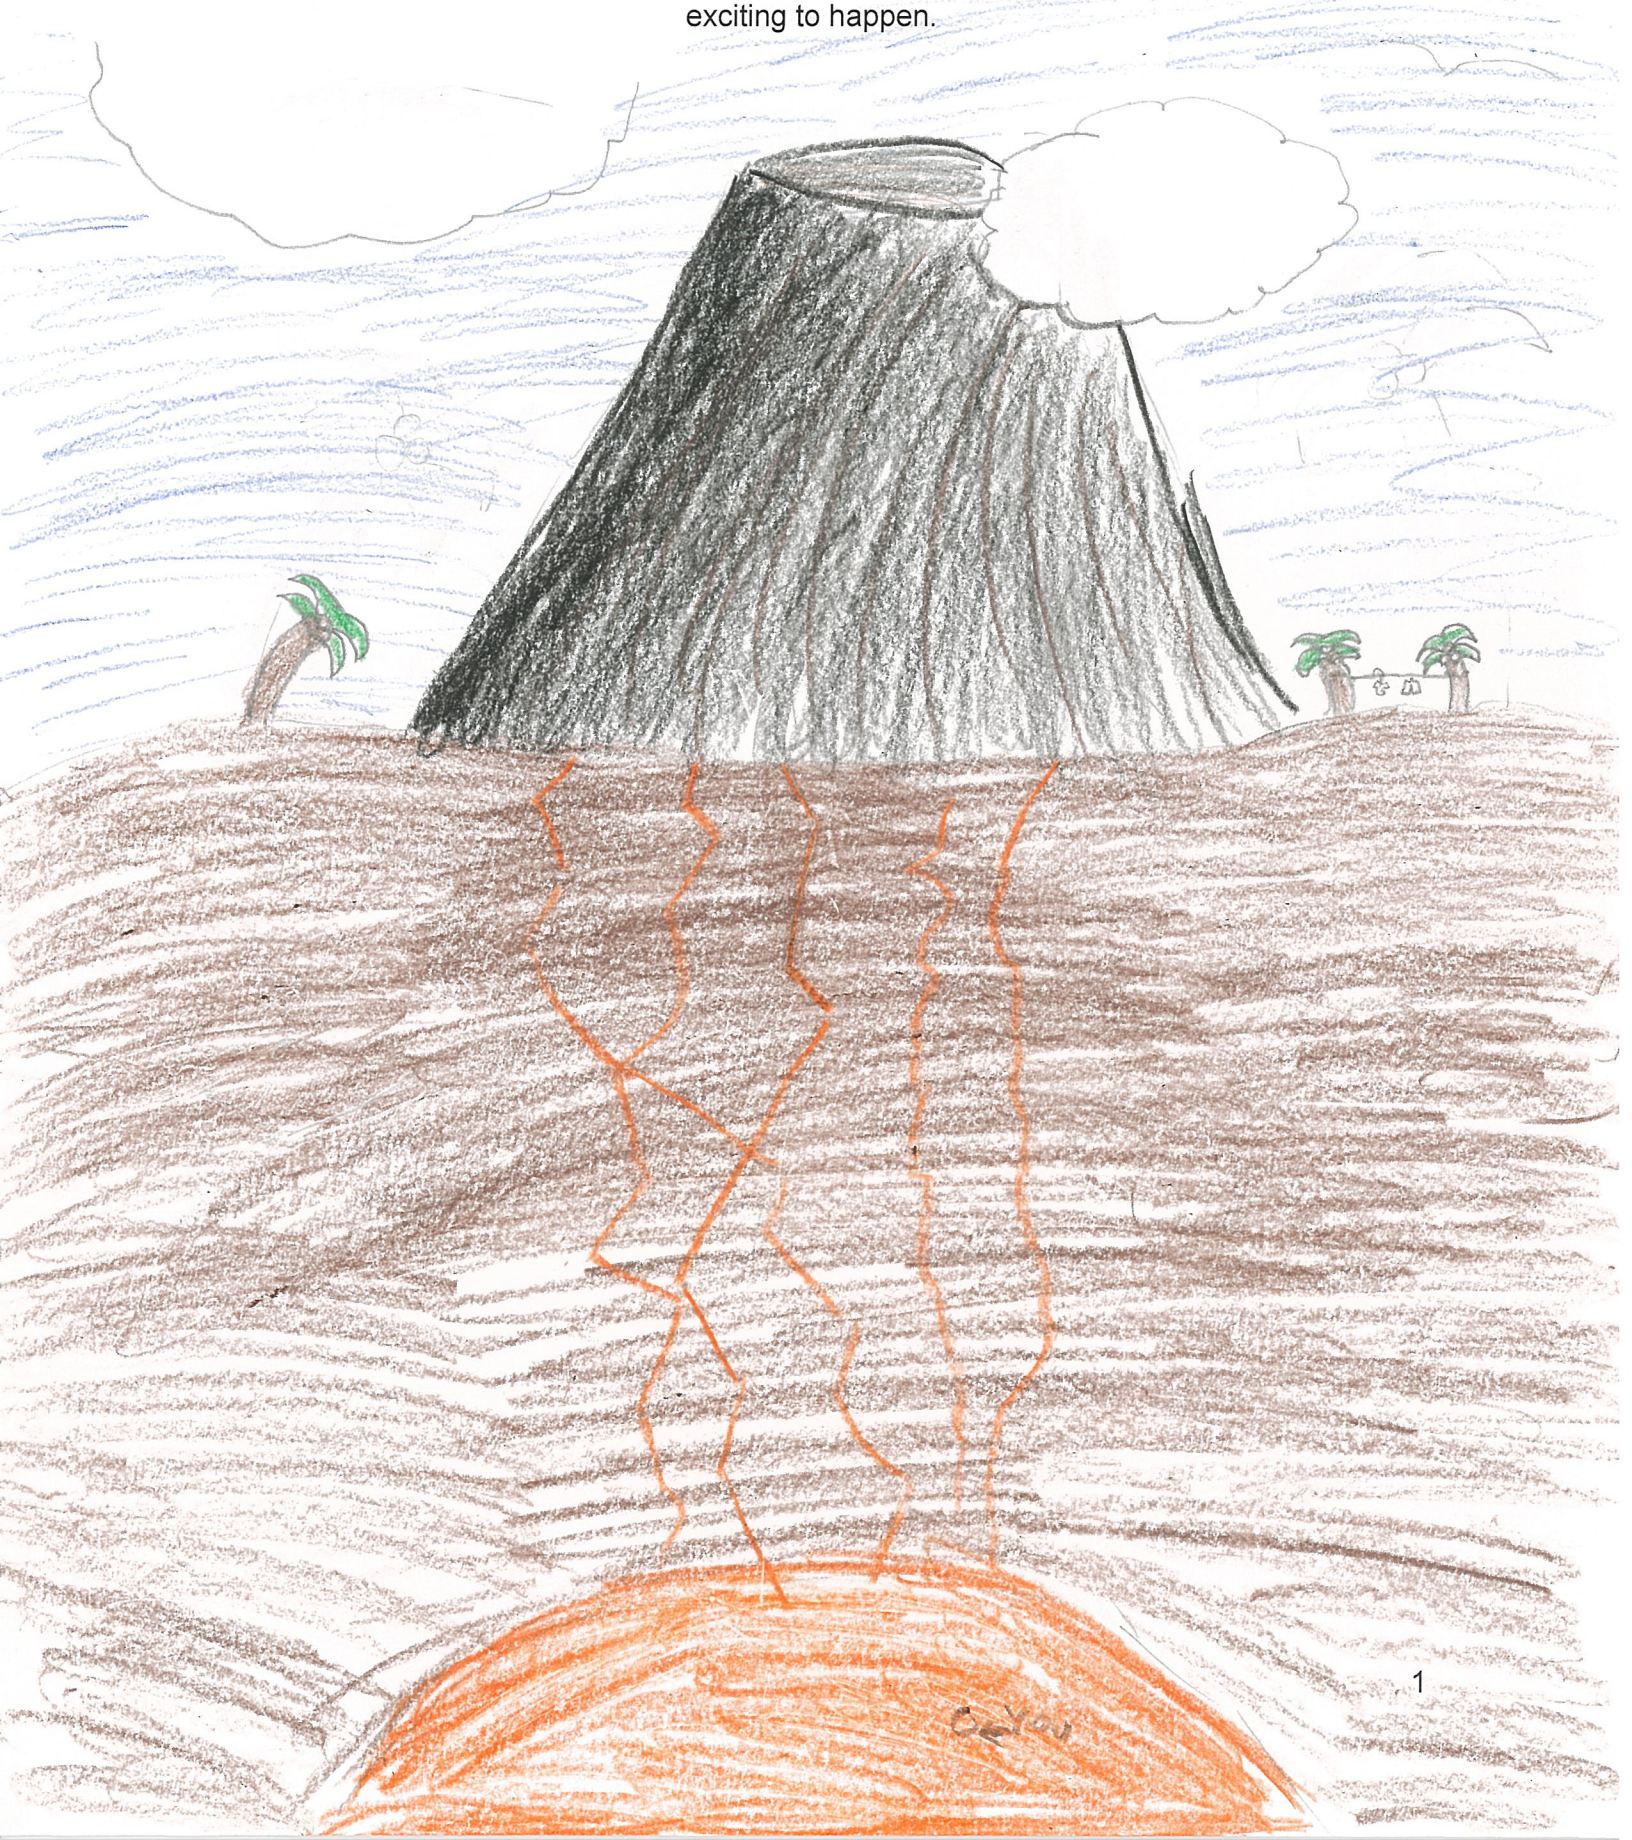
The Rock Story

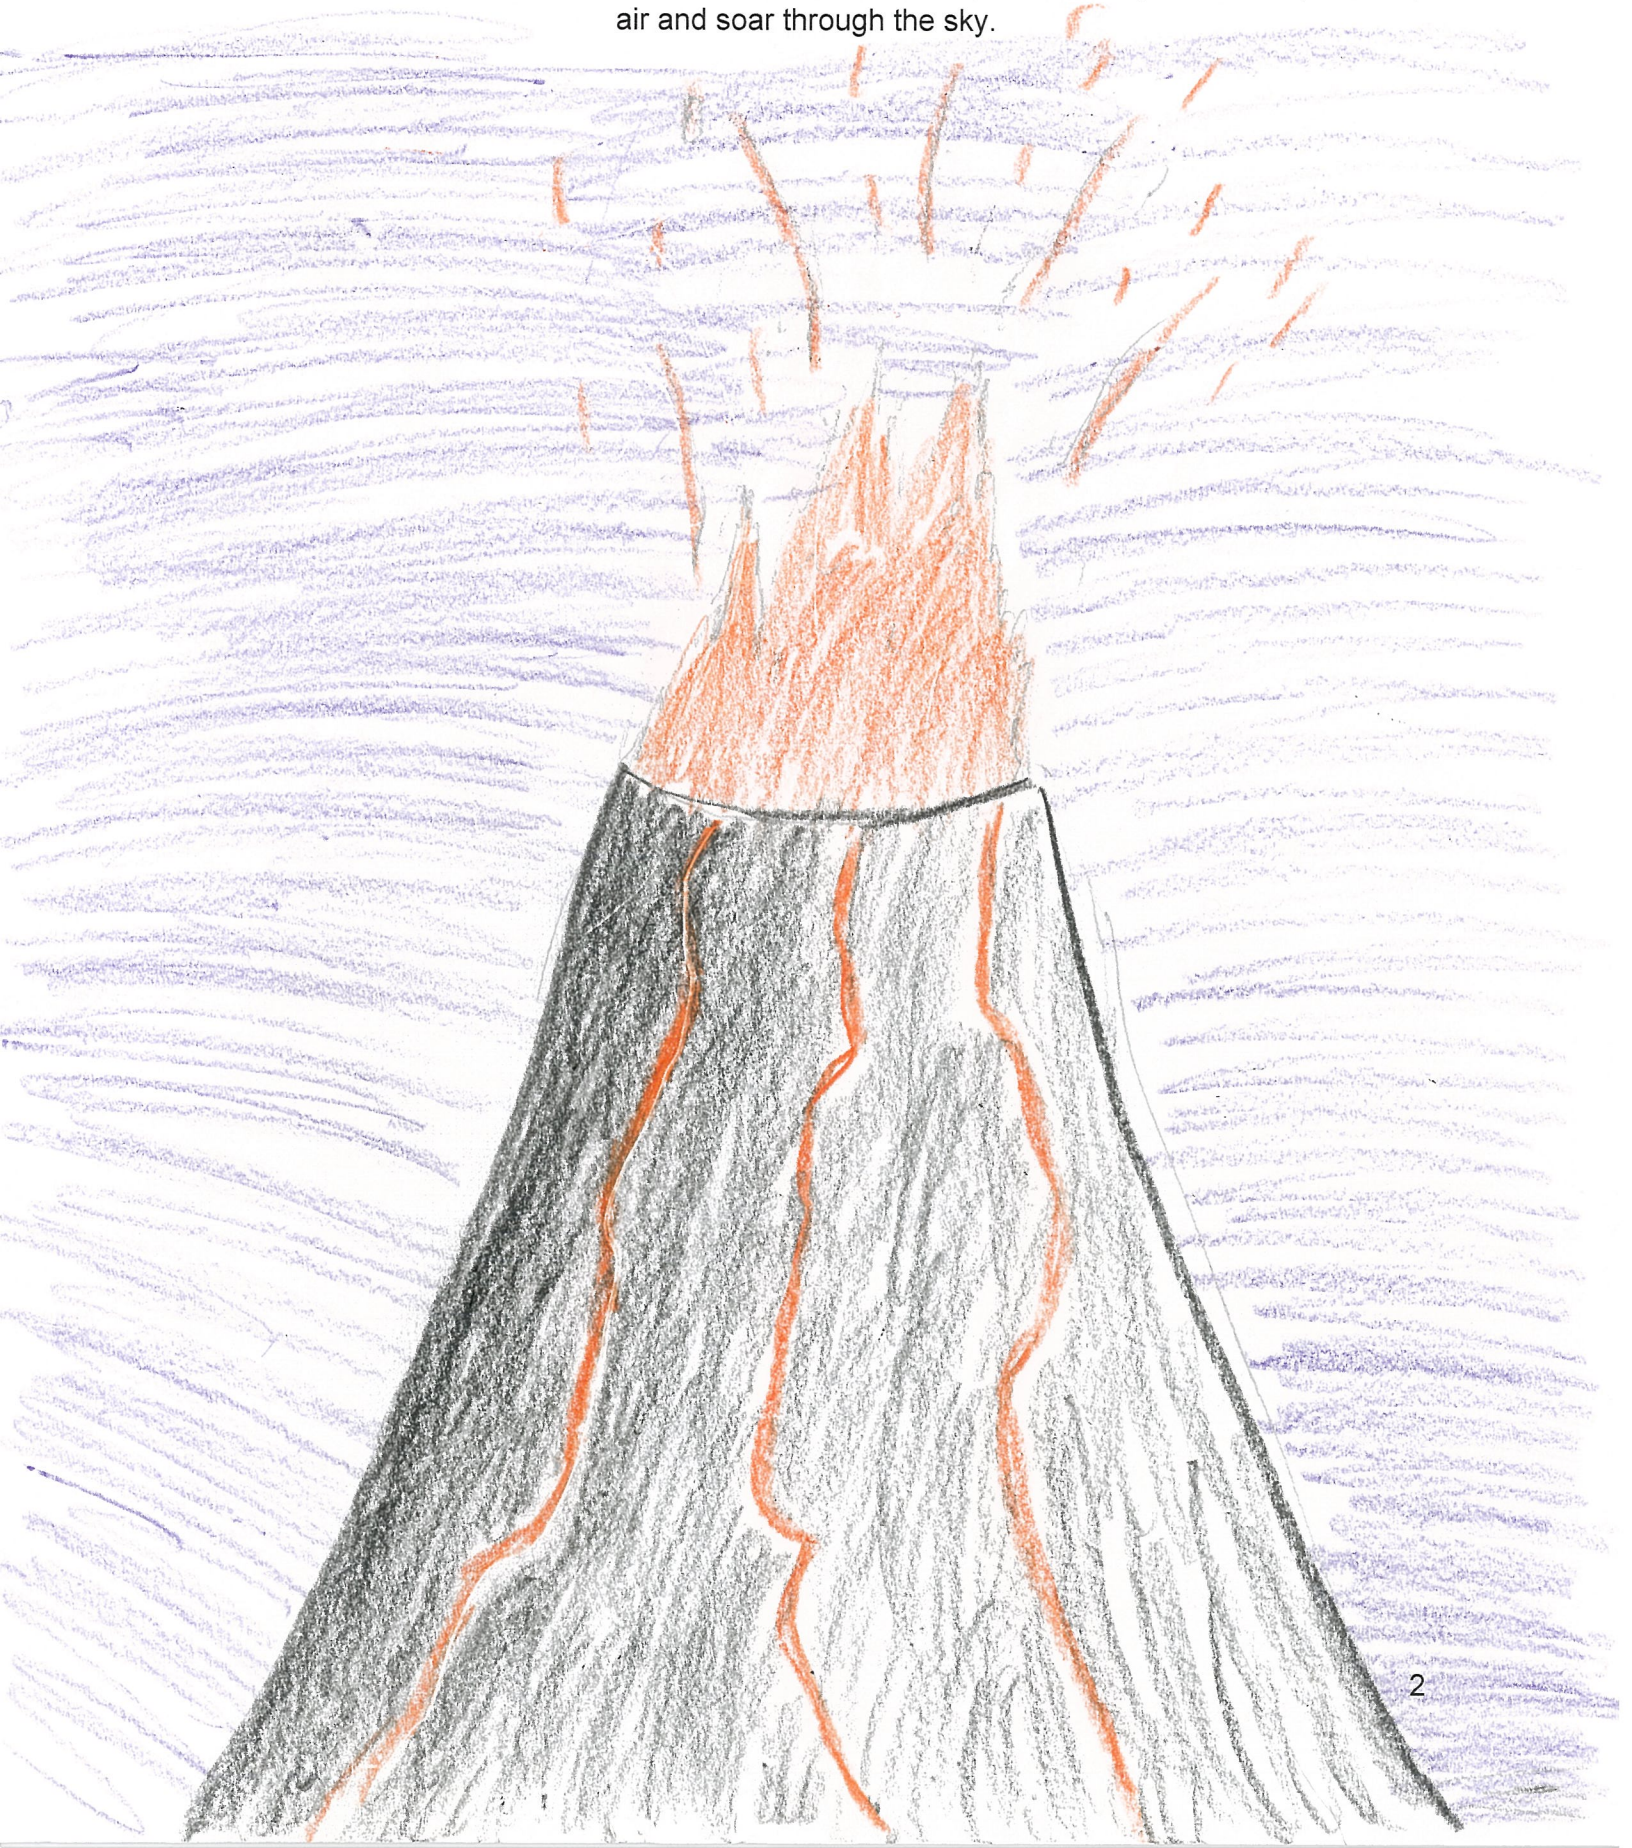


By: Sam and Cole

You are orange glowing magma. You sit two thousand six hundred feet under the Kilauea volcano. There you lurk for thousands of years waiting, and waiting for something exciting to happen.



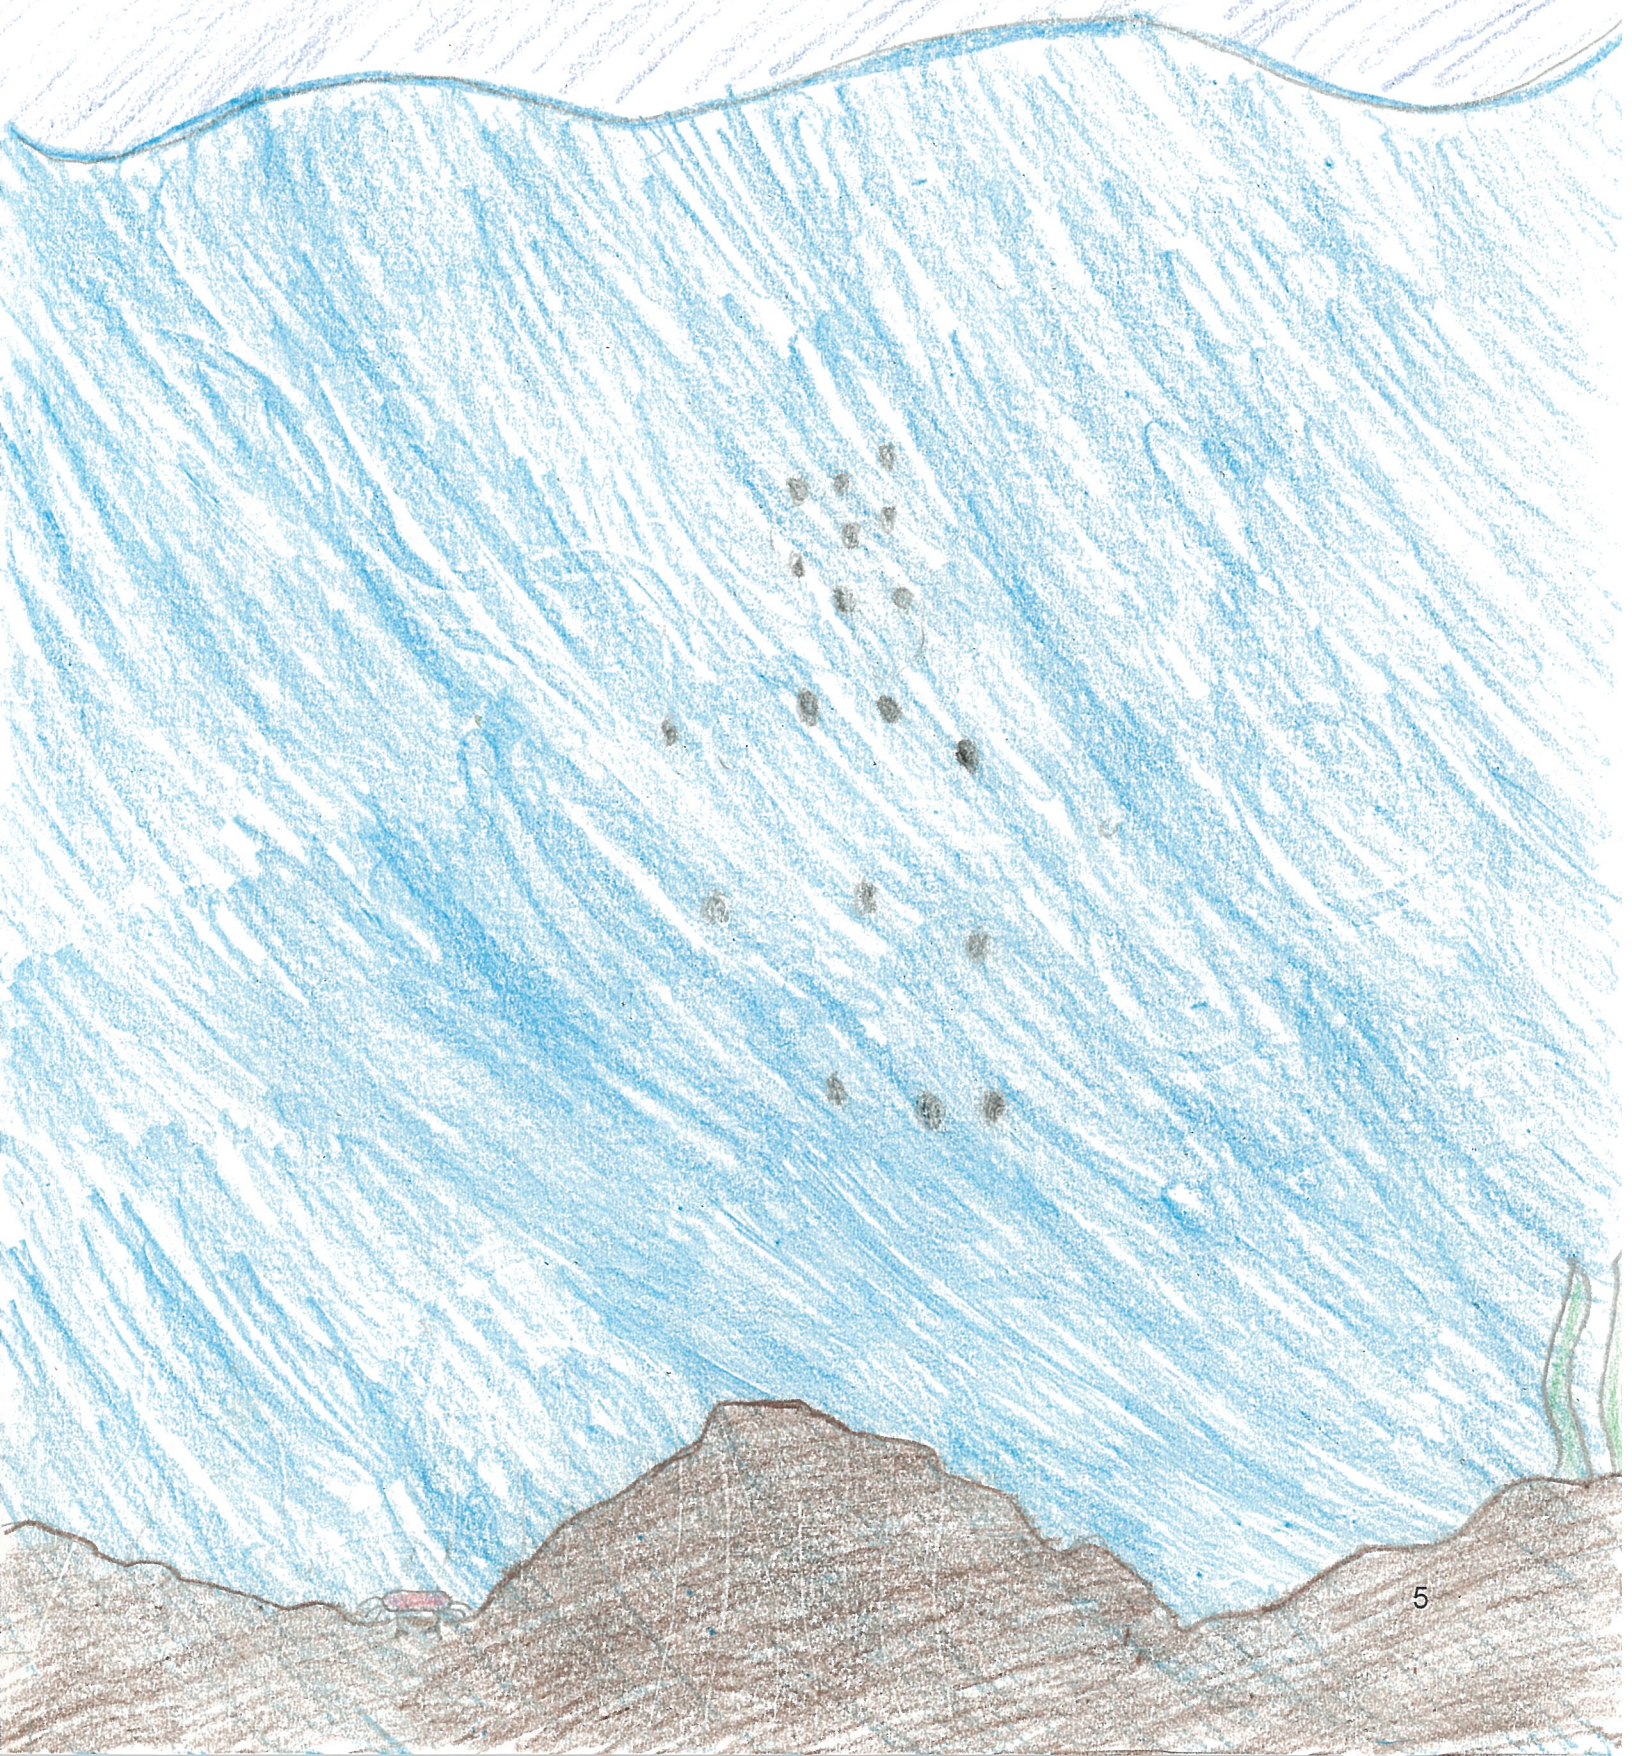
After thousands of years of stillness you start to feel a lot of pleasure build up beneath you. You start to twist, swirl and fly through the magma. Before you know it, you rocket up into the air and soar through the sky.



You slam against the ground and slowly start to flow down the volcano. As you near the bottom you start to harden. You become still and become an igneous rock.

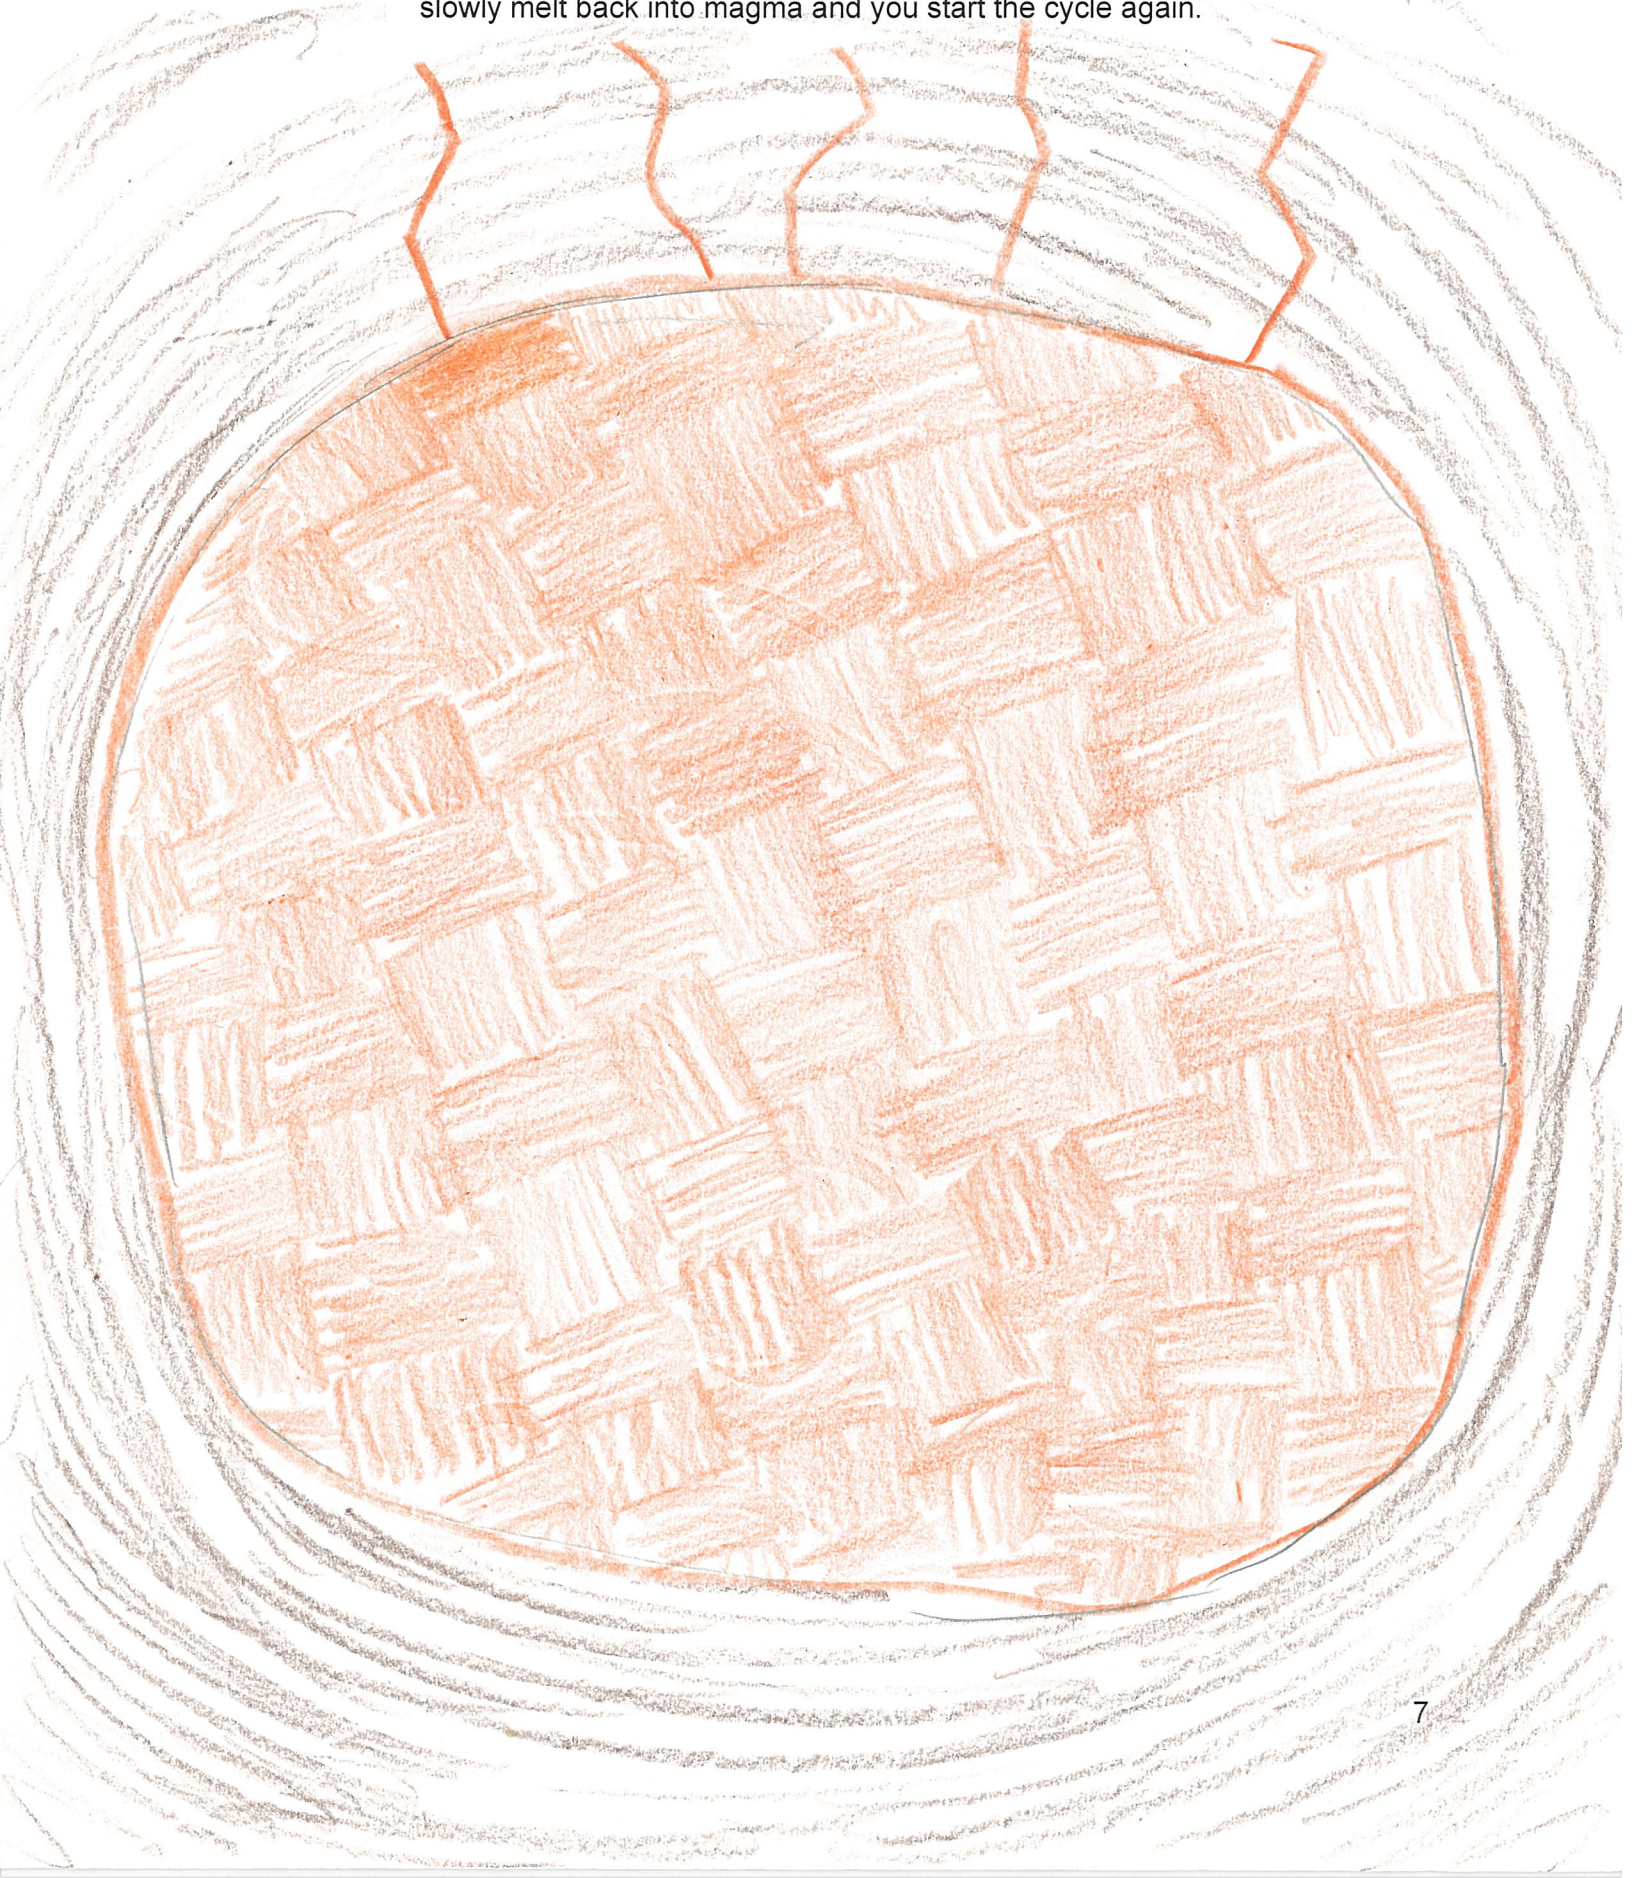
As time moves on you become weathered and start to break into many small pieces. They roll into the ocean below and plunge into the water.

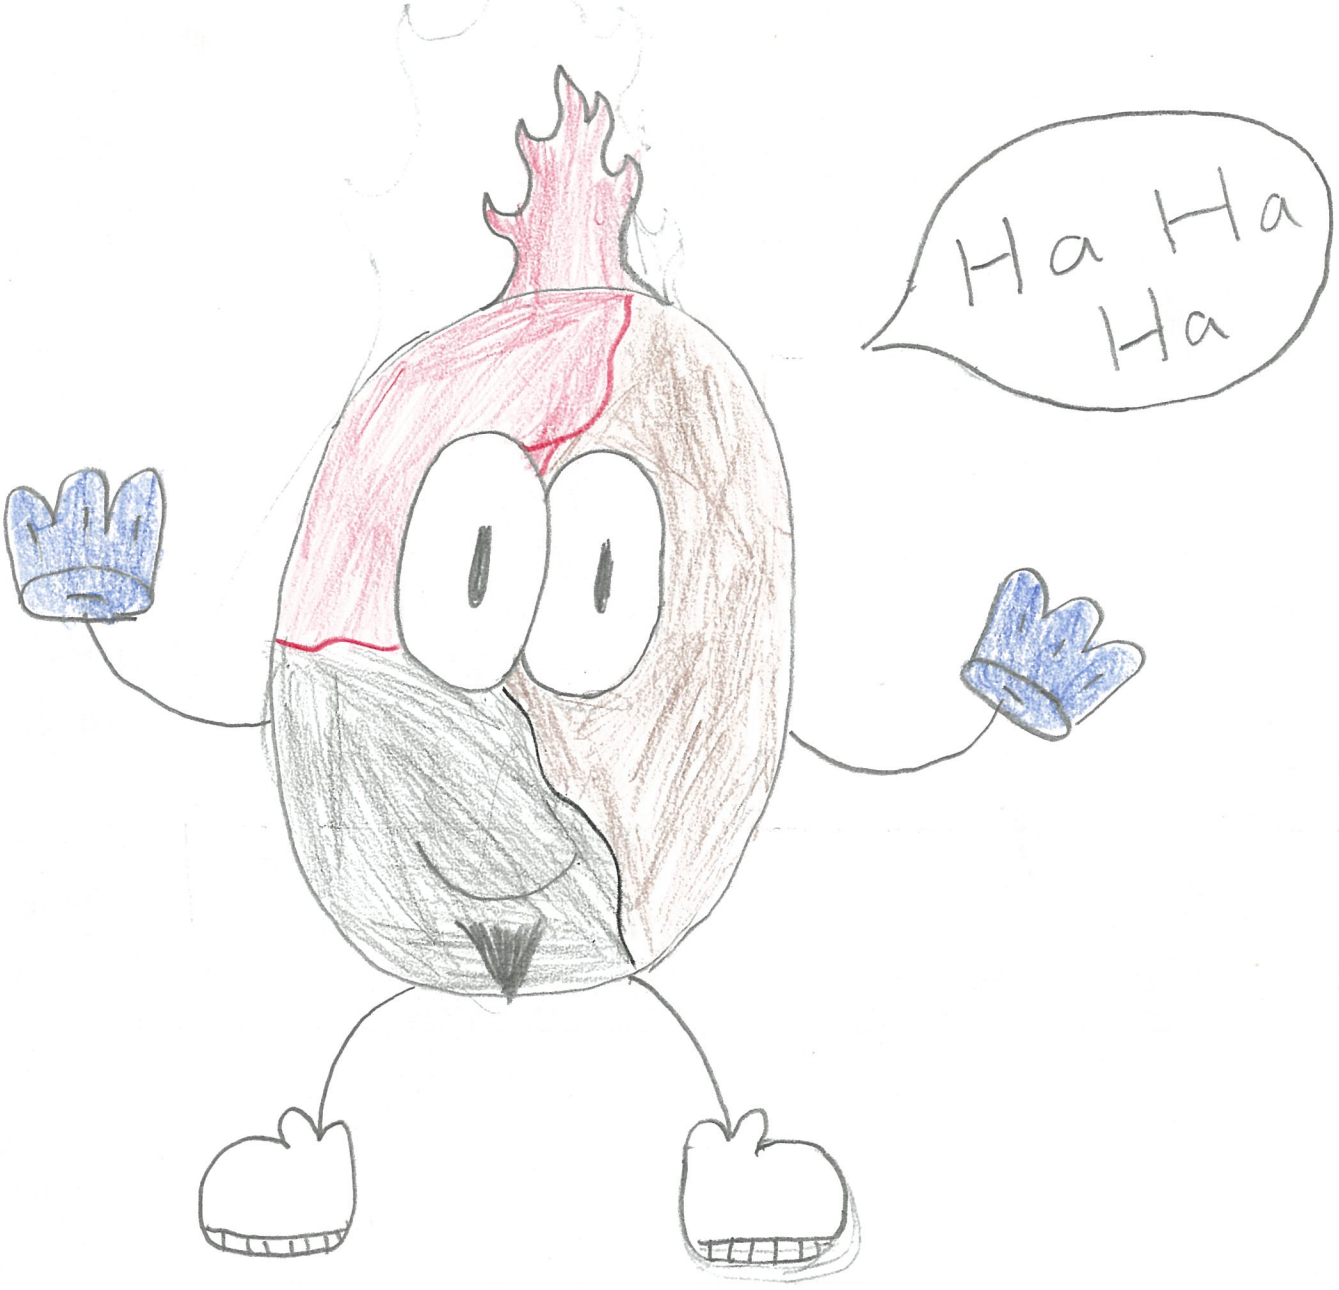
You sink down to the bottom of the ocean and break into smaller and smaller pieces. Your sediments are compacted together and you form a rock, a sedimentary rock.



The waves of the ocean push you back on the shore. For the millions of years you have been sitting on the beach you have been slowly sinking into the ground. After a while you become very hot and with the pressure of the earth you become a metamorphic rock.

You stay as a metamorphic rock for around two million years. Over that span of time you slowly melt back into magma and you start the cycle again.



The End


(Not really)
