K–12 teachers of science have been digging into the Next Generation Science Standards (NGSS) (NGSS Lead States 2013) to begin creating plans and processes for translating them for classroom instruction. As teachers learn about the NGSS, they have asked about the general structure of the standards document and how to read and use it. This article, part of a series about different aspects of the standards, answers some of the most common questions about the architecture of the NGSS, from deciphering the codes to understanding the boxes.

Q. What are the major components of the standards?  
A. Generally speaking, there are four major components on every standards page (Figure 1):

1. A code and title that describe the content of the standard;
2. A varying number of performance expectations that describe what students should be able to know and do at the end of instruction;
3. A foundation box that describes in more detail each of the three dimensions of the performance expectation; and
4. A connection box that includes connections to the standard from other disciplinary core ideas at the grade level and across grade levels and to the Common Core State Standards (CCSS) (NGAC and CCSSO 2010) in mathematics and English language arts and literacy.

Q. What exactly are performance expectations?  
A. The standards include performance expectations that describe what students should be able to know and do at the end of instruction. This is very different from previous national and state standards that had separate inquiry and content goals. The performance expectations combine three key dimensions:

1. Science and engineering practices (how science is conducted in the real world—such as through planning and carrying out investigations);
2. Disciplinary core ideas (the content—for example, biology); and
3. Crosscutting concepts (ideas—such as cause and effect—that permeate all the sciences).

Performance expectations describe what is to be assessed at the end of instruction and guide the development of assessments. Teachers should not use the performance expectations as a curriculum. Instead, they should use their own professional judgment about how learning should take place in the classroom, keeping in mind what students should be able to do by the end of instruction, as described by the performance expectation.

Q. How does the foundation box support the performance expectations? What do I do with this content?  
A. The foundation box provides a more complete description of the performance expectations. It describes the science and engineering practices, disciplinary core ideas, and crosscutting concepts used to make up a particular set of performance expectations. These are the “raw materials” that teachers can use to construct learning experiences for students.

Q. What do the colors represent?  
A. The foundation box has three separate areas that are color coded. The blue area represents science and engineering practices; the orange area is for disciplinary core ideas; and the green area is for crosscutting concepts. Sometimes, the text of performance expectations is color coded to indicate what part of the foundation box the text is based on.

Q: What is considered “the standard”? Is it the performance expectations or does it include the boxes below?  
A. Different states have different legal definitions for what they consider a “standard.” Some states, for example, consider a single performance expectation to be a standard. Other states may refer to an entire set of performance expectations (a topic) to be a standard. Still others may consider a set of performance expectations and the corresponding foundation box to be a standard. NSTA considers the content of the foundation boxes to be just as important as the performance expectations in planning curriculum, instruction, and assessment, so we consider the “standard” to be the performance expectations plus the material in the foundation box.

### MS.Weather and Climate

**Students who demonstrate understanding can:**

- **MS-ESS2-5.** Collect data to provide evidence for how the motions and complex interactions of air masses result in changes in weather conditions.  
  **Clarification Statement:** Emphasis is on how air masses flow from regions of high pressure to low pressure, causing weather (defined by temperature, pressure, humidity, precipitation, and wind) at a fixed location to change over time, and how sudden changes in weather can result when different air masses collide. Emphasis is on how weather can be predicted within probabilistic ranges. Examples of data can be provided to students (such as weather maps, diagrams, and visualizations) or obtained through laboratory experiments (such as with condensation).  
  **Assessment Boundary:** Assessment does not include reading the names of cloud types or weather symbols used on weather maps or the reported diagrams from weather stations.

- **MS-ESS2-6.** Develop and use a model to describe how unequal heating and rotation of the Earth cause patterns of atmospheric and oceanic circulation that determine regional climates.  
  **Clarification Statement:** Emphasis is on how patterns vary by latitude, altitude, and geographic land distribution. Emphasis of atmospheric circulation is on the sun-driven latitudinal banding, the Coriolis effect, and resulting prevailing winds; emphasis of ocean circulation is on the transfer of heat by the global ocean convection cycle, which is constrained by the Coriolis effect and the outlines of continents. Examples of models can be diagrams, maps and globes, or digital representations.  
  **Assessment Boundary:** Assessment does not include the dynamics of the Coriolis effect.

- **MS-ESS3-5.** Ask questions to clarify evidence of the factors that have caused the rise in global temperatures over the past century.  
  **Clarification Statement:** Examples of factors include human activities (such as fossil fuel combustion, cement production, and agricultural activity) and natural processes (such as changes in incoming solar radiation or volcanic activity). Examples of evidence can include tables, graphs, and maps of global and regional temperatures, atmospheric levels of gases such as carbon dioxide and methane, and the rates of human activities. Emphasis is on the major role that human activities play in causing the rise in global temperatures.

The performance expectations above were developed using the following elements from the NGSS document "A Framework for K-12 Science Education:"

<table>
<thead>
<tr>
<th>Science and Engineering Practices</th>
<th>Disciplinary Core Ideas</th>
<th>Crosscutting Concepts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asking Questions and Defining Problems</td>
<td><strong>ESS2.C: The Roles of Water in Earth’s Surface Processes</strong></td>
<td></td>

### Connections to other DCIs

- **MS-PS1.A** (MS-ESS2-5)
- **MS-PS2.A** (MS-ESS2-5)
- **MS-PS3.A** (MS-ESS3-5)
- **MS-PS4.B** (MS-ESS2-6)
- **MS-PS4.C** (MS-ESS2-6)

### Articulation of DCIs across grade bands:

- **3.PS1.A** (MS-ESS2-5)
- **3.PS2.D** (MS-ESS2-5)
- **5.ESS2.A** (MS-ESS2-5)
- **5.ESS3.1** (MS-ESS2-5)
- **5.ESS3.2** (MS-ESS2-6)
- **5.ESS3.3** (MS-ESS2-6)
- **5.ESS3.4** (MS-ESS2-6)
- **5.ESS3.5** (MS-ESS2-6)
- **5.ESS3.6** (MS-ESS2-6)
- **5.ESS3.7** (MS-ESS2-6)

### Common Core State Standards Connections:

- E.O. Literature –
- **RST.6-8.1**
- **RST.6-8.9**
- **W.HST.6-8.8**
- **SL.6-8.2**
- **MATH: Mathematics –**
- **MP.2**
- **6.NS.C.5**
- **6.EE.A.2**
- **6.EE.A.4**

### Additional Notes:

- **Cite specific text evidence to support analysis of science and technical texts.** (MS-ESS2-5), (MS-ESS3-5)
- **Compare and contrast the information gained from experiments, simulations, videos, or multimedia sources with that gained from reading a text on the same topic.** (MS-ESS2-6)
- **Gather relevant information from multiple print and digital sources; assess the credibility of each source; and quote paraphrase the data and conclusions of others while avoiding plagiarism and providing basic bibliographic information for sources.** (MS-ESS2-5)
- **Include multimedia components and visual displays in presentations to clarify claims and findings and emphasize salient points.** (MS-ESS2-6)
- **Reason abstractly and quantitatively.** (MS-ESS2-5), (MS-ESS3-5)
- **Use variables to represent quantities in a real-world or mathematical problem; understand that a variable can represent an unknown number, or, depending on the purpose at hand, any number in a specified set.** (MS-ESS2-5)
- **Use variables to represent quantities in a real-world or mathematical problem, and construct simple equations and inequalities to solve problems by reasoning about the quantities.** (MS-ESS3-5)
Q. Why are there two arrangements of the standards: one by disciplinary core idea and one by topic? Which arrangement is better for me to use?
A. Both in print and on the web, the standards are shown in two different arrangements. One arrangement (by disciplinary core idea) matches the organizational structure used by the writers of A Framework for K–12 Science Education (NRC 2012), a publication from the National Academies of Science that guided development of the NGSS. The other arrangement (by topic) matches the arrangement that was used by the educators who wrote the standards. Teachers can use either arrangement or make their own arrangements. In the elementary grades (K–5), the performance expectations are presented grade by grade. In middle school and high school, they are presented by grade bands (6–8 and 9–12). Beyond that, the standards do not specify any particular order or organization for their teaching.

Q. When designing instruction using a particular performance expectation, do I have to use the exact disciplinary core idea, practice, and crosscutting concept that make up the performance expectation?
A. Absolutely not. The performance expectations are not meant to prescribe what to do during instruction. Teachers have the freedom and professional responsibility to decide what learning experiences will be most effective in helping students achieve the outcomes described in the performance expectations. Furthermore, research indicates that students will learn best if they engage in multiple practices as they develop their understanding of core ideas and crosscutting concepts. Each lesson should be three dimensional, meaning that it should integrate at least one practice, core idea, and crosscutting concept. Teachers should develop a logical sequence of activities during instruction that will provide students the proper motivation to develop and use the practices, core ideas, and crosscutting concepts they are to learn.

Q. Some standards have a connection to the nature of science and to engineering, technology, and applications of science. How do those concepts get integrated into the standard?
A. Just as the practices, core ideas, and crosscutting concepts should be integrated in a way that fits them together naturally, the same approach should be used for the connections to the nature of science and to engineering, technology, and applications of science. The writers of the standards have identified some places where connections may work naturally, but teachers should look for other opportunities as well.

NSTA is dedicated to helping all teachers of science and school leaders better understand the important instructional shifts in the NGSS and translate them into classroom instruction. Whether you’re just beginning the process of exploring the NGSS or are already far along the path, NSTA has a growing number of tools and resources. Your starting place is the NGSS@NSTA Hub (www.nsta.org/ngss), where you will find our newest materials, including curated resources linked to the standards; a new interactive e-book called Discover the NGSS; NSTA Press books on topics such as Science for All; and videos to show you what NGSS instruction looks like in the classroom. Also, check out the official NGSS website (www.nextgenscience.org) that offers a detailed exploration of the NGSS architecture, the Educators Evaluating the Quality of Instructional Products (EQuIP) Rubric, and other resources (www.nextgenscience.org/resources). Also see the NSTA position statement on the NGSS (www.nsta.org/about/positions/ngss.aspx).

As educator Harold Pratt noted in his NSTA Reader’s Guide to the Next Generation Science Standards: “In rather straightforward terms, the NGSS has only two specific purposes beyond its broad vision for science education, namely (1) to describe the essential learning goals, and (2) to describe how those goals will be assessed at each grade level or band. The rest—instruction, instructional materials, assessments, curriculum, professional development, and the university preparation of teachers—is up to the science education community.”

There is much work ahead, but science teachers everywhere are embracing these exciting changes that are reinvigorating science education. Watch for future articles in this special series on the NGSS.
