

# Objects in the Sky

Different things can be seen in the sky.

Put a **D** next to the things that are seen **only** in the daylight.

Put an **N** next to the things that can be seen **only** at night.

Put a **B** next to the things that can be seen in **both** day and night.

\_\_\_ the Sun

\_\_\_ the Moon

\_\_\_ the next-nearest star to our Sun

\_\_\_ constellations

Explain your thinking. How did you decide when you could see different things in the sky?
